Trust to police

- Police is an important actor which is set to cement modern societies (Parsons, 1937; Foucault, 1975) through
 - legitimized social trust
 - legal enforcement power.
- However, policemen are only humans who may shirk, corrupt, and power abuse.
- If their 'imperfections' are too large, citizens will deny it of trust and participation, cooperation and control.
- This leads to *abstinence trap*: in the absence of control, police is even more likely to behave badly, confirming citizens' worst expectations.

Main arguments

- The *abstinence trap* (ловушка безучастности) is an equilibrium denial of public trust and cooperation with the police, which operates through two main channels:
 - endogenous adverse selection of police officers
 - unwillingness of citizens, esp. the most resourceful ones, to put pressure on the police in demand of high quality services.
- An *ultima causa* behind these motives is also twofold:
 - 1 poor moral and professional qualities of police officers
 - 2 reluctance of many citizens to comply with the law themselves (and hence, effective endorsement of lenience of the police).
- Common wisdom that '*toughness of the Russian laws is mitigated by their non-compulsory character*' is mutually endorsed by poor policemen and law-negligent citizens, resulting in weak Rule of Law.

Outline

- Formalization of the above arguments using a very simple game of incomplete information between police officers and citizens with outside option (private security provisions) with two sorts of equilibria:
 - good equilibria:** citizens report their problems to police, and police officers (PO) handle their requests to their best.
 - bad equilibria:** citizens abstain from filling their reports, using private means to solve their problems if they can, and leaving much of police activities at its own discretion, at the expense of public service.
- Illustrate predictions by means of a structural empirical model drawn on the results of an all-Moscow survey of police attitudes (1550 Moscovites conducted by Levada center in November-December 2011, using a quoted representative sample of all parts of the city.).
- Discuss extensions and policy implications.

Real and believed attitudes to police

Как Вы думаете, какой процент россиян относится сегодня к милиции...

Reporting to police ($N = 1550$)

victims of crime 117 (7.5%) have been victims at least once over the last year, of whom

- 111 have called at the police, and 63 (54% of those who complained) have filed an official police report
- 11 were tried to file the report, but it has not been registered
- 43 respondents (68% of reporting) said that something has been done following their report, of whom
- of whom 35 (81%) did not report dissatisfaction (i.e. were either completely or partially satisfied, or were neither satisfied nor dissatisfied).

witnesses of crime 159 (10%) have ever witnessed at least one crime (according to their judgment) over the last year, of which

- only 39 (25%) reported this to the police.
- of whom 26 people (66%) reported something has been done, and
- 19 of them (73%) were fully or partially satisfied with the reaction.

Why not reporting to the police?

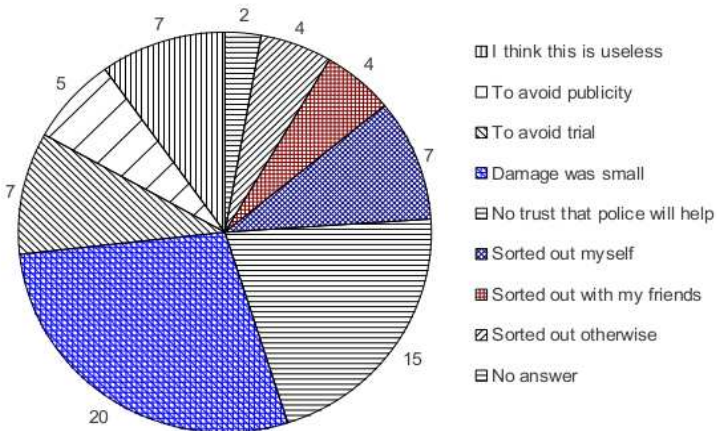

Рис.: Distribution of reasons for not calling at the police

Setup

A citizen with wealth w faces a legal damage x (burglary, street offence, robbery etc.) which may be fully or partly offset by the intervention of the police. Citizens can be of two types:

allegiant: share μ , who report to the police and enforce its action by all means as required by the Law

sceptical: share $1 - \mu$, who fill the report only if they believe police will help.

Police officers can be of two types:

honest: share λ , who always protect legal interests of the citizens to their best

infirm: share $1 - \lambda$, who do so only if private benefits exceed private costs, given the structure of incentives.

Types of players are common knowledge, but types of particular agents is unknown (incomplete information).

Payoffs

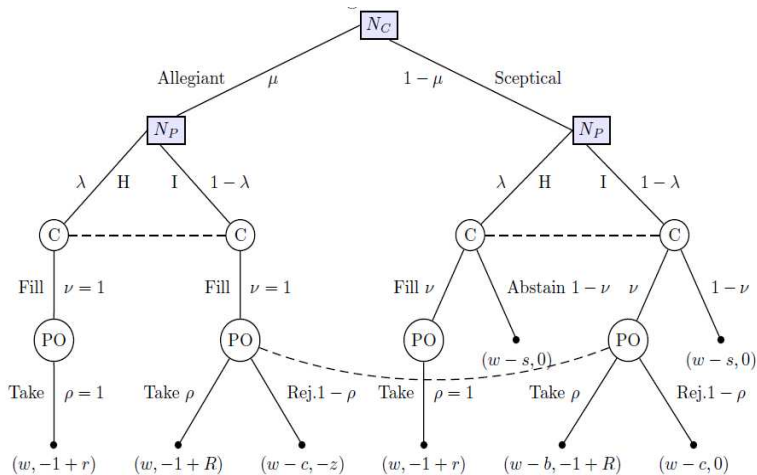

Allegiant citizens always report. Sceptical citizens either

- Fill the complaint (strategy ν), restoring their wealth to w if they face a honest policemen, or face Rejection, in which case their terminal wealth is $w - c < w$
- Abstain from filling the complaint, incurring private recovery costs (private detectives, guards etc.) with terminal wealth $w - s$.

Honest POs always Take the complaints, at private normalized cost of 1 and net benefits $r < 1$ (short of lump-sum salary and bonuses). Infirm POs filter the complaints in terms of their solvability, and either

- Take them, resulting in larger personal reward of $R > r$, and lower utility $w - b$ to citizens, or
- Reject them, in which case they face penalty $z > 0$, but only if the citizen is allegiant, and pledges to the PO's bosses

Game tree

Equilibria for

For sceptical citizens and infirm officers, we have:

Good equilibria: If $\mu > \frac{1-R}{z}$, then $\lambda > \frac{b-s}{b}$ implies there is an equilibrium with $\nu = 1$ and $\rho = 1$: sceptical citizens always report, and infirm police officers take complaints. This is the first-best, typical of modern developed countries.

Bad equilibria: If $\mu < \frac{1-R}{z}$, $\lambda < \frac{c-s}{c}$, then $\nu = 0$ and $\rho = 0$ with

- $c > s$: sceptical citizens never report, using private means to solve their problems if they can, and infirm police officers would reject their complaints. This is valid for normal and resourceful people; poor people have no private solutions.
- $c < s$: dominant strategy equilibrium, in which all sceptical citizens try to use private solutions, regardless of the share λ of good officers. Then citizens and police live in separate worlds, pretty much like in Russia (!).

Some implications

- Abstinance starts from the most resourcesul people, which decreases the likelihood that bad practices will be driven out of the police offices
- The greater are gains from private solutions (lower s), the more likely it is that resourceful people will prefer not to deal with the police at all \Rightarrow good private security system harms police quality and welfare of the general public
- Social structure matters for the chances for moving from bad to good equilibiria: the more *resourceful* people are also *allegiant*, the greater is the likelihood of good equilibrium.
- Bribery is not necessary to obtain these results, but it aggravates the problem, and makes it more likely that society gets stacked in bad equilibria.

Why not reporting to the police?

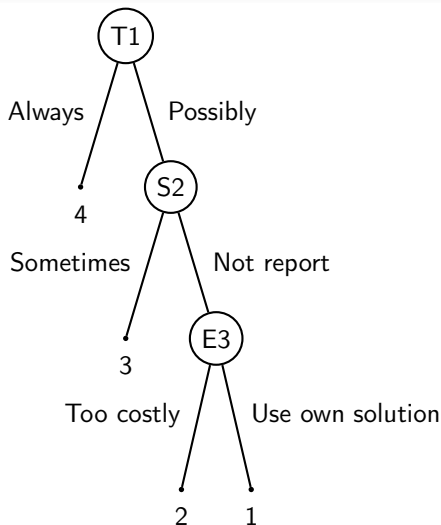

Рис.: Decision tree

Empirical strategy

Identify levels of people reasoning from the survey questionnaire: once you face a problem, you decide whether to be allegiant and always report (node 4), or sceptical, in which case you may sometimes report to the police (node 3), and sometimes not, either because this is too costly (node 2), or because they prefer to seek their own solution (node 1).

We evaluate the factors determining these decisions using nested logit model for the choice of each of the 4 nodes:

$$\Pr(\delta_i = j | X) = \frac{\exp(u_{ij}/\lambda_k) \cdot \left(\sum_{j' \in B_k} \exp(u_{ij'}/\lambda_k) \right)^{\lambda_k - 1}}{\sum_{k'=1}^K \left(\sum_{j' \in B_{k'}} \exp(u_{ij'}/\lambda_{k'}) \right)^{\lambda_{k'}}$$

Distribution of data

reporting \ att.law	Never breach	Possible in social inter.	Possible in own interests
none, some damage	3	17	2
none, small damage	2	17	0
reporting	18	51	3

Таблица: Construction of dependent variable

Node 4 are allegiant,

Node 3 are sceptical but report,

Node 2 are non-reporters for cost reasons, and

Node 1 are non-reporters because of other means to solve the problem.
